

# MOTHS AT LANDGUARD POINT, SUFFOLK

## 2004

In 1991 & 1992 a battery operated Heath Trap was run. From 1993 onwards a Robinson Trap, kindly supplied by the Suffolk Naturalists Society, was operated. A second Robinson trap was operated from 1996 onwards. During 2004 two traps were run from February 14th to December 8th. Dates referred to are for the mornings on which the trap was emptied or for day time records the date they were seen. Traps were emptied & identification carried out by Nigel Odin, Mike Marsh, Richard Cope, Jeff Higgott & Justin Zantboer. Several national experts helped to confirm records. The classified list is intended to give some idea of flight times & includes some records found by cold searching. Only RDB, BAP species, some migrants and scarce species are counted. Some micro's are remaining unidentified due to lack of available expertise. Species added to the Landguard list in 2004 can be determined by reference to the list of Lepidoptera 1991 - 2004. Anyone out there who would like to help empty traps is more than welcome to become involved. The classified list is a summary of a vast amount of data collected. A few specimens for 2004 are still to be determined, these records will be included in next years annual report if thought to be relevant.

Nomenclature and numeration are from Bradley and Fletcher (1986) with revisions.
