

MOTHS AT LANDGUARD POINT, SUFFOLK

2007

During 2007 two Robinson traps were run from March 1st to December 4th. In addition a 15W Actinic trap was run on 141 nights. Dates referred to are for the mornings on which the trap was emptied or for day time records the date they were seen. Traps were emptied & identification carried out by Nigel Odin, Roger Skeen, Mike Marsh, Jeff Higgott & Steve Goddard. Several national experts helped to confirm records. Normally only RDB, BAP species, some migrants and scarce species are counted. Counts are included this year for several species that were formerly to numerous to count. Many species had a poor year with many regulars failing to appear or only showing up in very poor numbers. Micro's in particular had a poor year. Hopefully this situation is a one off and not a sign of a greater malaise. Some micro's are not identified due to a lack of time required for determination. Species added to the Landguard list in 2007 can be determined by reference to the list of Lepidoptera 1991 - 2007. A few specimens for 2007 and from some previous years are still to be determined, these records will be included in future annual reports if thought to be relevant. All records included below are for 2007 unless stated. Nomenclature and numeration are from Bradley and Fletcher (1986) with revisions.
