

MOTHS AT LANDGUARD POINT, SUFFOLK

2011

During 2011 two Robinson traps & a twin 30 watt actinic trap were run nightly February 26th to December 7th. Dates referred to are for the mornings on which the trap was emptied or for day time records the date they were seen. Traps were emptied & identification carried out by Nigel Odin with help from Jeff Higgott, Mike Marsh & Eric Patrick. Several national experts helped to confirm records. Some micro's trapped are not identified due to a lack of time required for determination. Species added to the site list in 2011 can be determined by reference to the list of Lepidoptera 1991 - 2011. A few specimens for 2011 and from some previous years are still to be determined, these records will be included in future annual reports if thought to be relevant. All records included below are for 2011 unless stated. Nomenclature and numeration are from Bradley and Fletcher (1986) with revisions.
