

MOTHS AT LANDGUARD POINT SUFFOLK 2025

In 2025 two Robinson mv traps plus a twin 20 watt Actinic were run nightly 20th February to 30th November. Dates referred to are for the mornings traps were emptied or for daytime records the day they were seen. Traps were emptied & identification carried out by Nigel Odin with help from Will Brame, Mike Marsh & Eric Patrick. Some micros are not identified due to a lack of time required for determination. A few specimens from previous years are still to be determined, these records will be included in future reports if thought to be relevant.  
All records below are for 2025 unless otherwise stated.
